

Secure Software Development Lifecycle (SSDLC) Evidence

Application: **CHT Platform SDK** (Zoom Meeting SDK / Embed) · Organization: **Community Health Media**

1. Purpose

This document describes the secure software development practices used to build and operate the Community Health Technologies (CHT) Platform, including the Zoom Meeting SDK integration used for in-browser webinar and office-hours join. It is provided as supporting evidence for Zoom Marketplace review.

2. Scope

Applies to the **cht-platform-tool** monorepo: NestJS API, React frontend, Python worker, Terraform infrastructure, and CI/CD pipelines that deploy to AWS (devapp / testapp).

3. Development lifecycle controls

Control	Implementation
Source control	GitHub private repository; feature branches; protected main / release flow
Peer review	Pull requests required for production paths; branch policy workflow for main merges
Automated validation	PR Validation workflow: install, typecheck/build (backend + frontend), Terraform validate
Testing before deploy	Deploy workflows run backend/frontend tests for changed lanes before image/frontend roll
Infrastructure as code	AWS resources managed with Terraform; plan + manual approval before apply in CI
Secrets management	Zoom SDK/S2S secrets and other credentials in AWS Secrets Manager / GitHub Environments — not committed
Least privilege deploy	OIDC role assumption for GitHub Actions; environment-scoped secrets (development / platform)
Change scope control	Path-based deploy lanes (backend / frontend / infra) so only changed components ship
Operational readiness	Documented incident response and disaster recovery runbooks under docs/compliance/

4. Zoom-specific secure design

Meeting SDK join credentials are minted **server-side** after CHT authentication and enrollment/approval checks. Learners receive short-lived JWTs (attendee role). End users do not receive Zoom SDK secrets. Webhook authenticity uses the Zoom webhook secret. Production embeds run behind CloudFront with restrictive framing / COOP-COEP headers.

5. Evidence references (repository)

- .github/workflows/pr-validation.yml
- .github/workflows/deploy-dev.yml / deploy-prod.yml
- .github/workflows/branch-policy.yml

- infrastructure/ (Terraform)

6. Attestation

Community Health Media attests that the above controls are in active use for CHT Platform development as of 2026-08-13. Formal SOC 2 Type II certification is not claimed in this document.
